Using cutting edge technologies, **TACTICAL SATELLITE** has developed a rapid Auto Deployment Satellite Communications System, "TAC-SAT™" for tactical and emergency communications purposes.

The System enables the user to within minutes of arrival at the incident scene to deploy a high speed satellite link and network utilizing Very Small Aperture Terminal (VSAT) equipment and Motorola Mesh Network™ technologies that will communicate secure high speed Internet (IP), Telephone - Voice Over Internet Protocol (VOIP), Radio Over Internet Protocol (ROIP), Fax, Data, Image and Video Conference and Streaming transmissions at speeds unachievable only a few months ago. Typical transmission speeds are at 512 Mbps upload and 1.5 Mbps download and can be increased.

The System is packaged for rapid deployment and can be delivered throughout the United States and Canada within 24 hours of request. An "EERA" - Emergency Equipment Rental Agreement is in place. (see inset)

The System enables the user to develop its' own secure wired and/or wireless "TLAN" Tactical Local Area Network based on the current requirements of the Incident. Personnel will be able to communicate in a bi-directional manner thru multiple channels without sharing telephones or computers. Down time waiting for the uploading or down loading of data via the Internet is minimal. The System is also scaleable, allowing for additional computer or communications equipment to be configured within minutes. Additionally, VPN, WPA and WEP 64/128 bit encryption are enabled through the System. ***Our mission: Customer Satisfaction. In the business of Emergency Service, there is no room for excuses.***
